1 PROBLEM 70 FROM GATE EC

Let X and Y be continuous random variables with the joint probability distribution function

$$f(x,y) = \begin{cases} ae^{-2y}, & 0 < x < y < \infty \\ 0, & \text{otherwise} \end{cases}$$

The value of $E(X|Y = 2)$ is

- (A) 4 (B) 3 (C) 2 (D) 1

2 SOLUTION

Given two continuous random variables X and Y, whose joint probability distribution function is

$$f(x,y) = \begin{cases} ae^{-2y}, & 0 < x < y < \infty \\ 0, & \text{otherwise} \end{cases} \quad (2.0.1)$$

We are asked to find the value of $E(X|Y = 2)$. Since $Y=2$, we can say that the probability distribution function of x in this case is

$$\Pr(X = x) = \begin{cases} ae^{-2 \times 2}, & 0 < x < 2 \\ 0 & \text{otherwise} \end{cases} \quad (2.0.2)$$

From the properties of the joint probability function,

$$\iint_{-\infty}^{\infty} f(x,y) dx dy = 1 \quad (2.0.3)$$

From the definition of the joint probability equation, Equation 2.0.3 can be written as

$$\int_0^{\infty} \left(\int_0^y ae^{-2y} dx \right) dy = 1 \quad (2.0.4)$$

$$\int_0^{\infty} \left(ae^{-2y} \int_0^y 1 dx \right) dy = 1 \quad (2.0.5)$$

$$\int_0^{\infty} (ae^{-2y}y) dy = 1 \quad (2.0.6)$$

$$a \int_0^{\infty} e^{-2y}y dy = 1 \quad (2.0.7)$$

$$a \left(-\frac{1}{2} e^{-2y} \left(y + \frac{1}{2} \right) \right) \Big|_0^{\infty} = 1 \quad (2.0.8)$$

$$a \left(\frac{1}{4} \right) = 1 \quad (2.0.9)$$

$$\Rightarrow a = 4 \quad (2.0.10)$$

Hence, Equation 2.0.2 can be written as

$$\Pr(X = x) = \begin{cases} 4e^{-4}, & 0 < x < 2 \\ 0 & \text{otherwise} \end{cases} \quad (2.0.11)$$

We know, for a continuous random variable,

$$E(X) = \int_{-\infty}^{\infty} x \Pr(X = x) dx \quad (2.0.12)$$

$$= \int_{-\infty}^0 x \Pr(X = x) dx + \int_0^2 x \Pr(X = x) dx + \int_2^{\infty} x \Pr(X = x) dx \quad (2.0.13)$$

$$= 0 + \int_0^2 (x \times 4e^{-4}) dx + 0 \quad (2.0.14)$$

$$= 4e^{-4} \left(\frac{x^2}{2} \right) \Big|_0^2 \quad (2.0.15)$$

$$= 4e^{-4} \times 2 \quad (2.0.16)$$

$$(2.0.17)$$

$$\boxed{E(X) = 0.146} \quad (2.0.18)$$
